

ABSTRACT

1 A method and system for customizing a computerized system
2 having a plurality of operating features, including
3 selecting at least one independent parameter from a
4 predefined list of parameters for selecting at least one
5 of the operating features of the customized computerized
6 system, and storing the independent parameter in a
7 parameter set. The at least one of the selected
8 operating features is enabled by selecting at least one
9 secondary parameter from a predefined list of secondary
10 parameters, wherein the secondary parameters are
11 associated with the at least one independent parameter,
12 and at least one secondary parameter is stored in the
13 parameter set. At least one dependent parameter is
14 determined for configuring the computerized system,
15 wherein the dependent parameter is generated from a
16 predefined list of dependent parameters in accordance
17 with the parameter set, and the dependent parameter is
18 added to the parameter set. A compilation of parameters
19 is installed in the customized computerized system, where
20 the compilation of parameters is generated from the
21 parameter set, wherein the compilation of parameters
22 enables the selected operating features of the customized
23 computerized system.
